

Step 1: Clone Repo

Option 1: Direct usage only

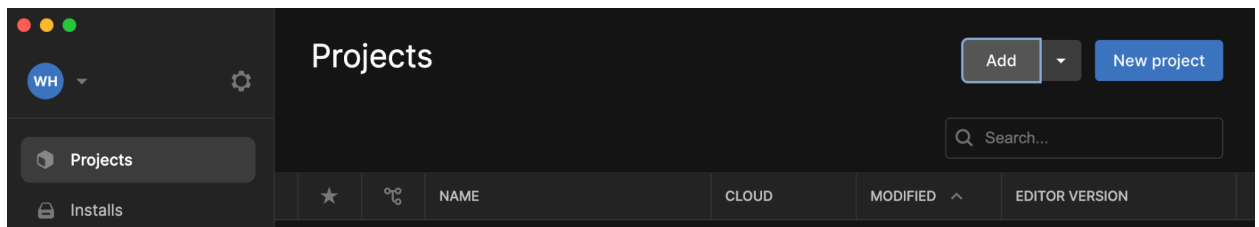

Clone the repo into any local position

Option 2: Requires adjustments from changes.csv and resulting CSV files

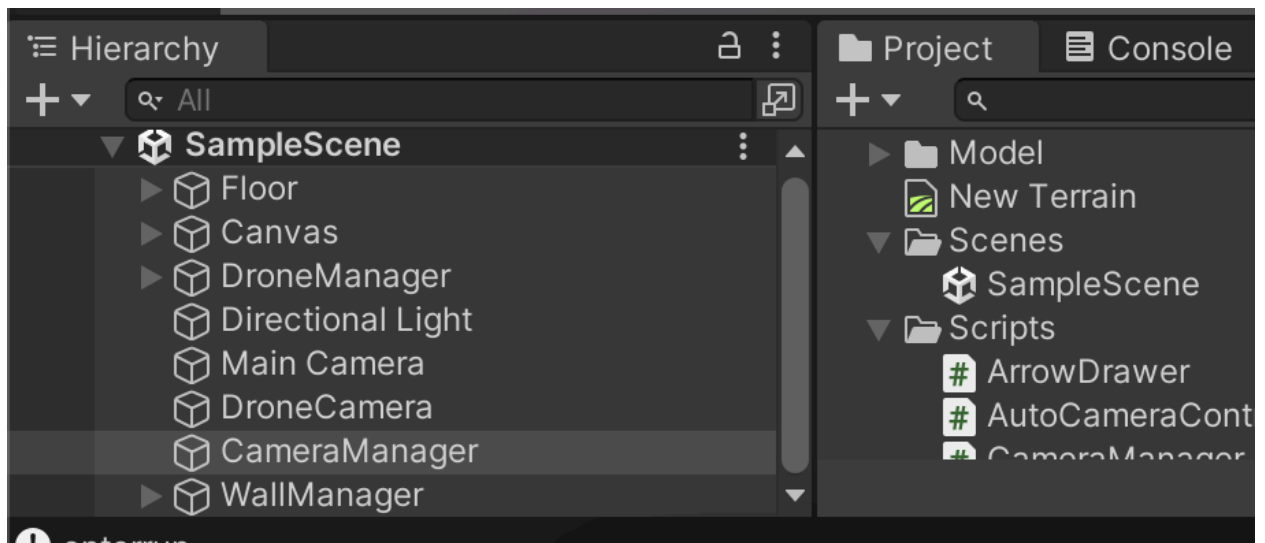

1. Create a folder droneSim locally
2. Clone the droneUnity repo within folder droneSim
3. Clone the lw3Dsim repo within folder droneSim
4. In the future, any changes from changes.csv in lw3Dsim will be reflected in the simulation if PRINT=true.

Step 2: Unity Installation

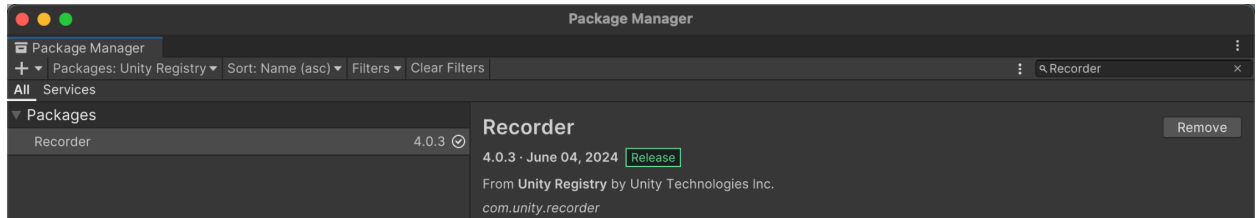

1. Install Unity according to website suggestions.
2. Click Add and select droneUnity repo

3. Change the editor version to 2022.3.34f1 (maybe not necessary but prevents bugs in case). It needs quite some time to download proper packages
4. When opening the project, it defaults to an untitled screen, drag the SampleScene from Assets/Scene in Project tab to the Hierarchy column

- After opening the project, go to Window >> Package Manager, select Unity Registry and search for Recorder then download it.

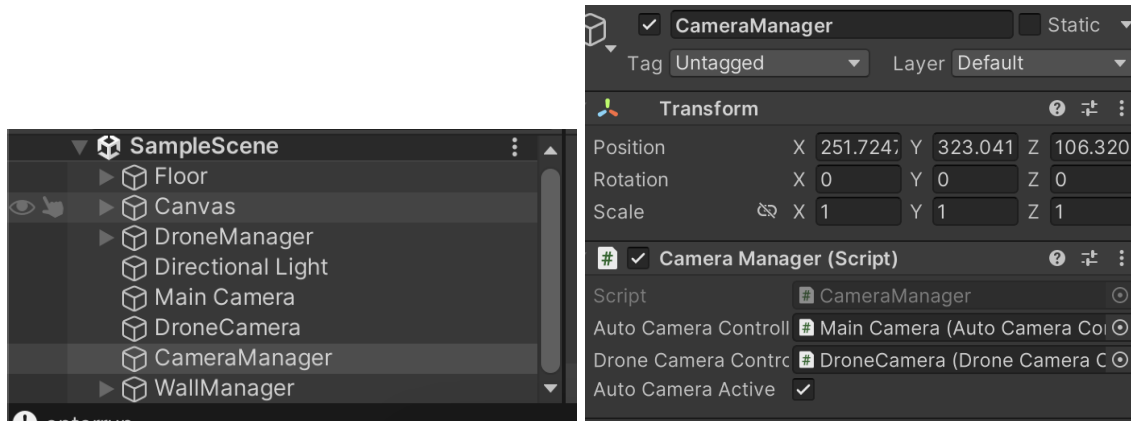

Step 3: Record the Simulation

- Go to Window >> General >> Recorder >> Recorder Window, then select add recorder with a movie type

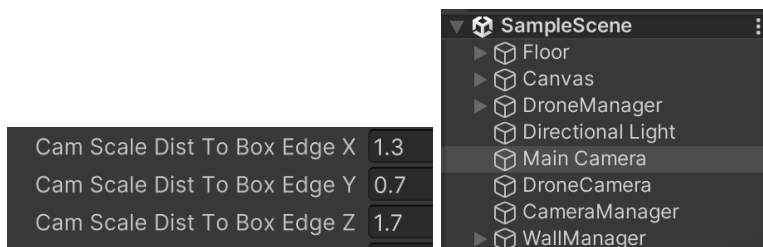

Side Note: screen may appear lagging or freezing, but the movie will be properly recorded.

Step 5: Useful Parameters to tune if needed before run time

- Camera Switching:** toggle Auto Camera Active in CameraManager object

- AutoCam Placement:** Adjust the ratio in x, y, z, direction from Main Camera object through Cam Scale Dist ...

- Rotation of the path:** change roll pitch yaw fields in inspector window in DroneManager object. Each of them is -90 ~ 90 degrees.

Step 6: Useful Parameters to tune if needed before run time

- Drone interpolation speed:** in DroneManager object, change Interpolation Speed field from Inspector Window.

2. **Auto Camera Interpolation Speed:** in MainCamera object, change Cam Interpolation Speed field from Inspector Window.
3. **Secodary Mode Rotation Toggle:** in MainCamera object, toggle Rotate For Secondary field from Inspector Window.
